

Gege elologic Cylinder "Upgrade Mobility"

The Gege elologic cylinder combines the proven mechanical Gege cylinder systems with modern Legic® identification. As with the Kaba elologic cylinder, double security is provided by the "AND" link - mechanical and electronic coding - to unlock the cylinder. The cylinder can only be opened if both codes are correct. Any door can be retrofitted to a stand-alone access control system with little effort.

Integration with Security

Gege elolegic cylinders provide - completely in line with the Kaba philosophy, full integration and compatibility to Gege mechanical systems, to the Kaba elolegic product family and to on line access control of the Kaba exos world. This product is especially attractive for Gege licensees who have installed a broad base of Gege master key systems. Product development has paid special attention to ease in retrofitting. The Gege elolegic cylinder's electronics and battery are installed completely safe from manipulation in an extra mortise in the door leaf. The Gege elolegic compact cylinder has the battery and electronics in the knob on the inside, requiring no modifications to the door.

Flexible Applications

Gege elolegic cylinders are excellently suited for existing master key systems which are to be expanded by electronic identification or Legic® applications, such as time attendance. Also for new sites in the area of apartment complexes and commercial buildings as well as public buildings, Gege elolegic cylinders combined with mechanical master key systems and other mechatronic Kaba elolegic products find attractive and flexible applications.

Contactless Data Transfer

Der Legic® chip for contactless, encrypted data transfer meeting the highest security criteria is located in the

clip attached onto the key bow.

The electronically controlled locking mechanism of the cylinder is built into the yoke of the cylinder housing. In the various installation styles the cylinders are operated autonomously, without any external wiring. Media can be programmed or deleted at the cylinder with special programming keys or with the hand held Kaba elolegic programming device or most conveniently with Kaba elo Manager software. Gege elolegic cylinders are available in two electronic versions, the 'N-' (no time) and 'T-' (time) Lines. If required, time restrictions can be programmed for individual media and a trace back can be downloaded for evaluation of transactions and incidents.
